

**Amendments to the Claims**

**This listing of claims will replace all prior versions, and listings, of the claims:**

1. (currently amended) A method of performing online computer maintenance on at least one node, the method comprising:

running a virtual machine monitor;

running a first operating system instance on the virtual machine monitor;

configuring hardware to trap instructions executed by the first operating system instance;

simulating trapped instructions with the virtual machine monitor;

running a second operating system instance on the virtual machine monitor as a substitute for the first operating system instance; and

performing the maintenance with respect to one of the first and second operating system instances while using the other of the first and second operating system instances.

2. (currently amended) The method of claim 1, wherein the second operating system instance is run as a substitute by migrating at least one application from the first operating system instance to the second operating system instance, and using the migrated applications on the second operating system instance.

3. (currently amended) The method of claim 1, further comprising shutting down the first operating system instance after the second operating system instance has been run as a substitute for the first operating system instance.

4. (currently amended) The method of claim 1, wherein the maintenance includes hardware servicing; and wherein the second operating system instance is run without a dependency on ~~the~~ hardware to be serviced.

5. (currently amended) The method of claim 4, wherein the servicing includes removing ~~the~~ hardware from the at least one ~~a~~ node.

6. (currently amended) The method of claim 4, wherein the virtual machine monitor is used to hide ~~the~~ hardware to be serviced from the second operating system instance during bootup of the second operating system instance.

7. (currently amended) The method of claim 4, wherein the virtual machine monitor releases its own dependencies on ~~that~~ hardware prior to removal.

8. (currently amended) The method of claim 1, wherein the maintenance includes adding the hardware ~~addition~~; wherein the virtual machine monitor discovers the ~~added~~ hardware; and wherein the virtual machine monitor shields the first operating system instance from the hardware as the hardware is being added.

9. (currently amended) The method of claim 8, wherein the hardware is added before the second operating system instance is booted; and wherein the second operating system instance is allowed during bootup to see the ~~added~~ hardware.

10. (currently amended) The method of claim 1, wherein applications running on the first operating system instance are migrated to the second operating system instance; and wherein software maintenance is performed.

11. (currently amended) The method of claim 10, further comprising shutting down one of the first and second operating system instances after the applications have been migrated.

12. (currently amended) The method of claim 1, wherein the second operating system instance is an upgraded operating system; and wherein applications running on the first operating system instance are migrated to the second operating system instance.

13. (currently amended) The method of claim 1, wherein the maintenance includes modifying the second operating system instance; and wherein the method further includes

migrating applications running on the first operating system instance to the second operating system instance.

14. (currently amended) The method of claim 1, further comprising migrating applications from the first operating system instance to the second operating system instance before the maintenance is performed; migrating the applications from the second operating system instance back to the first operating system instance after the maintenance has been performed; and shutting down the second operating system instance following the application migration to the first operating system instance.

15. (currently amended) The method of claim 1, wherein a first application instance is running on the first operating system instance before the maintenance is performed; and wherein the maintenance includes running a second application instance on the second operating system-OS instance, ~~and~~ modifying the second application instance, and cutting over from the first application instance to the modified second application instance.

16. (currently amended) The method of claim 1, wherein the virtual machine monitor allows at least one of the first and second operating system operating system instances to have direct control over at least one of a processing unit, memory and I/O of the at least one node.

17. (currently amended) The method of claim 1, wherein the first operating system instance is booted prior to running the virtual machine monitor; and wherein the virtual machine monitor is interposed beneath the first operating system instance when maintenance is to be performed.

18. (original) The method of claim 1, wherein at least one of a processing unit, memory and I/O is devirtualized after the maintenance has been performed.

19. (currently amended) The method of claim 1, wherein a single processor is used to run the virtual machine monitor and the first and second-~~multiple~~ operating system instances.

20. (currently amended) The method of claim 1, wherein a single node is used to run the virtual machine monitor and the first and second~~multiple~~ operating system instances.

21. (currently amended) A node comprising a processing unit and memory for the processing unit, the memory encoded with a virtual machine monitor and an operating system, the virtual machine monitor running a second instance of the operating system when a first instance of the operating system is already running in the node, the second instance being run when maintenance is to be performed, the second instance being a substitute for the first instance, the virtual machine monitor allowing the maintenance to be performed with respect to one of the instances while using the other of the instances wherein the virtual machine monitor configures hardware to trap privileged instructions to create an illusion that the first instance has control of the hardware.

22. (currently amended) The node of claim 21, wherein the second instance~~operating system~~ is run as a substitute by migrating at least one application from the first instance to the second instance, and using the at least one application~~migrated applications~~ on the second instance.

23. (currently amended) The node of claim 21, wherein the virtual machine monitor shuts down the first instance after the second instance has been run as a substitute for the first instance.

24. (currently amended) The node of claim 21-23, wherein the virtual machine monitor is used to hide~~the~~ hardware to be serviced from the second instance during bootup of the second instance.

25. (currently amended) The node of claim 21, wherein the maintenance includes adding hardware~~addition~~; wherein the virtual machine monitor discovers the added hardware; and wherein the virtual machine monitor shields the first~~operating system~~ instance from the added hardware as the added hardware is being added.

26. (currently amended) The node of claim 25, wherein the added hardware is added before the second instance is booted; and wherein during bootup the virtual machine monitor allows second instance to see the added hardware.

27. (currently amended) The node of claim 21, wherein applications running on the first ~~operating-system~~ instance are migrated to the second instance; and wherein software maintenance is performed.

28. (currently amended) The node of claim 21, wherein the maintenance includes modifying the second ~~operating-system~~ instance; and wherein applications running on the first ~~operating-system~~ instance are migrated to the second instance.

29. (currently amended) The node of claim 21, wherein applications are migrated from the first instance to the second instance before the maintenance is performed; the applications are migrated from the second instance back to the first instance after the maintenance has been performed; and wherein the virtual machine monitor shuts down the second instance after the applications are migrated ~~following the application migration~~ to the first instance.

30. (currently amended) The node of claim 21, wherein the virtual machine monitor allows at least one of the first and second ~~operating-system~~ instances to have direct control over at least one of a processing unit, memory and I/O of the at least one node.

31. (currently amended) The node of claim 21, wherein the first instance is booted prior to running the virtual machine monitor; and wherein the virtual machine monitor is interposed beneath the first ~~operating-system~~ instance when maintenance is to be performed.

32. (original) The node of claim 21, wherein the virtual machine monitor devirtualizes at least one of a processing unit, memory and I/O after the maintenance has been performed.

33. (currently amended) An article for a processing unit of a node, the article comprising computer memory encoded with a virtual machine monitor for running first and second instances of an operating system, the second instance being run when maintenance on the node is to be performed, the second instance being a substitute for the first instance, the virtual machine monitor allowing the maintenance to be performed with respect to one of the first and second instances while using the other of the first and second instances, wherein the virtual machine monitor configures hardware to trap instructions to create an illusion that the first instance has control of the hardware.

34. (currently amended) The article of claim 33, wherein the virtual machine monitor shuts down the first instance after the second instance has been run as a substitute for the first instance.

35. (currently amended) The article of claim 33-34, wherein the virtual machine monitor is used to hide ~~the~~ hardware to be serviced from the second instance during bootup of the second instance.

36. (currently amended) The article of claim 33, wherein the maintenance includes adding hardware ~~addition~~; wherein the virtual machine monitor discovers the added hardware; and wherein the virtual machine monitor shields the first ~~operating system~~ instance from the added hardware as the added hardware is being added.

37. (currently amended) The article of claim 36, wherein the added hardware is added before the second instance is booted; and wherein during bootup the virtual machine monitor allows the second instance to see the added hardware.

38. (currently amended) The article of claim 33, wherein the virtual machine monitor causes applications running on the first ~~operating system~~ instance to be migrated to the second instance in order to perform; ~~whereby software maintenance can be performed.~~

39. (currently amended) The article of claim 33, wherein the maintenance includes modifying the second-~~operating-system~~ instance; and wherein the virtual machine monitor causes applications running on the first-~~operating-system~~ instance to be migrated to the second instance.

40. (currently amended) The article of claim 33, wherein the virtual machine monitor causes applications to be migrated from the first instance to the second instance before the maintenance is performed; wherein the virtual machine monitor causes the applications to be migrated from the second instance back to the first instance after the maintenance has been performed; and wherein the virtual machine monitor shuts down the second instance after the applications are migrated ~~following the application migration~~ to the first instance.

41. (currently amended) The article of claim 33, wherein the virtual machine monitor allows at least one of the first and second ~~operating-system~~ instances to have direct control over at least one of a processing unit, memory and I/O of the at least one node.

42. (currently amended) The article of claim 33, wherein first instance is booted prior to running the virtual machine monitor; and wherein the virtual machine monitor is interposed beneath the first-~~operating-system~~ instance when maintenance is to be performed.

43. (original) The article of claim 33, wherein the virtual machine monitor can devirtualize at least one of a processing unit, memory and I/O after the maintenance has been performed.
